#### Mouse Monoclonal Antibody CD8 $\alpha$ conjugated to Sepharose Beads

CatalogNo: ANT8067-M

Size 200ul

Storage Store at 4 °C for frequent use

Description

This Antagene antibody is immobilized by the covalent reaction of hydrazinonicotinamidemodified antibody with formylbenzamide-modified beads. It is useful for immunoprecipitation.

### CD8 $\alpha$ (ANT0017R) Rabbit mAb

Formulation: Each vial contains 1mg/ml Magnetic Bead in PBS, pH 7.2, 0.05mg ANaN3.

| issue specificity of     | CD8 on thymus-derived T-cells usually consists of a disulfide-linked alpha/CD8A and a<br>beta/CD8B chain. Less frequently, CD8 can be expressed as a CD8A homodimer. A subset of<br>natural killer cells, memory T-cells, intraepithelial lymphocytes, monocytes and dendritic<br>cells expresses CD8A homodimers. Expressed at the cell surface of plasmacytoid dendritic<br>cells upon herpes simplex virus-1 stimulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |                 |
| Function                 | Disease:Defects in CD8A are a cause of familial CD8 deficiency (CD8 deficiency)<br>[MIM:608957]. Familial CD8 deficiency is a novel autosomal recessive immunologic defect<br>characterized by absence of CD8+ cells, leading to recurrent bacterial<br>infections.,Function:Identifies cytotoxic/suppressor T-cells that interact with MHC class I<br>bearing targets. CD8 is thought to play a role in the process of T-cell mediated killing. CD8<br>alpha chains binds to class I MHC molecules alpha-3 domains.,online information:CD8<br>entry,online information:CD8A mutation db,ANTM:All of the five most carboxyl-terminal<br>cysteines form inter-chain disulfide bonds in dimers and higher multimers, while the four<br>Nterminal cysteines do not.,similarity:Contains 1 Ig-like V-type (immunoglobulin-like)<br>domain.,subunit:In general heterodimer of an alpha and a beta chain linked by two disulfide<br>bonds. Can also form homodimers. Shown to be expressed as heterdimer on thymocytes<br>and as homodimer on peripheral blood T-lymphocytes. Interacts with the MHC class I HLA-<br>A/B2M dimer. Interacts with LCK in a zinc-dependent manner., |              |                 |

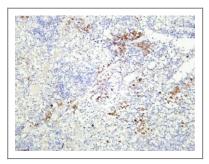

## Validation Data

Various whole cell lysates were separated by 4-20% SDS-PAGE, and the membrane was blotted with anti-CD8  $\alpha$  (ANT0017R) antibody. The HRPconjugated Goat anti-Rabbit IgG(H + L) antibody was used to detect the antibody. Lane 1: Mouse thymus Lane 2: Mouse spleen Lane 3: MOLT-4 Lane 4: Raji Lane 5: SNU-1 Lane 6: HCT-116 Predicted band size: 26kDa Observed band size: 35kDa

Human colon was stained with Anti-CD8  $\alpha$  (ANT0017R) rabbit antibody

Rat spleen was stained with Anti-CD8  $\alpha$  (ANT0017R) rabbit antibody

Mouse spleen was stained with Anti-CD8  $\alpha$  (ANT0017R) rabbit antibody
