FunctionFunction:Functions in the early steps of protein synthesis by forming a ternary complex with<br/>GTP and initiator tRNA. This complex binds to a 40S ribosomal subunit, followed by mRNA<br/>binding to form a 43S preinitiation complex. Junction of the 60S ribosomal subunit to form<br/>the 80S initiation complex is preceded by hydrolysis of the GTP bound to eIF-2 and release<br/>of an eIF-2-GDP binary complex. In order for eIF-2 to recycle and catalyze another round of<br/>initiation, the GDP bound to eIF-2 must exchange with GTP by way of a reaction catalyzed<br/>by eIF-2B.,ANTM:Substrate for at least 4 kinases: EIF2AK3/PERK, GCN2, HRI and PKR.<br/>Phosphorylation stabilizes the eIF-2/GDP/eIF-2B complex and prevents GDP/GTP exchange<br/>reaction, thus impairing the recycling of eIF-2 between successive rounds of initiation and<br/>leading to global inhibition of translation. In case of infection by vaccinia virus or rotavirus<br/>A, eIF2S1 phosphorylation state is modulated.,similarity:Belongs to the eIF-2-alpha<br/>family.,similarity:Contains 1 S1 motif domain.,subunit:Heterotrimer composed of an alpha,<br/>a beta and a gamma chain. Component of an EIF2 complex at least composed of CUGBP1,<br/>CALR, CALR3, EIF2S1, EIF2S2, HSP90B1 and HSPA5.,
